1. Implementation Plan

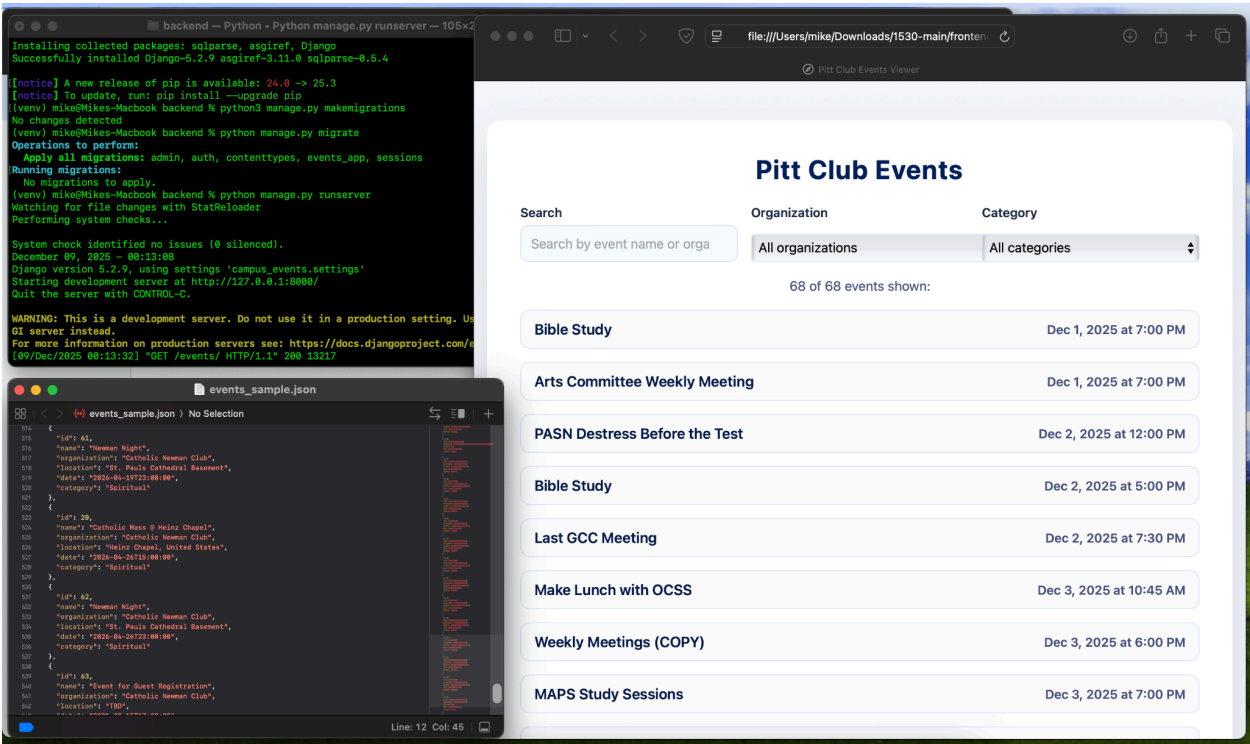

#Task	Description	Assigned To	Status
1 [BACKEND] Define DB schema for events & orgs	Create Django models for Organization and Event. Run migrations and register them in Django admin.	Annie	Complete
2 [DATA] Migrate JSON events into DB	Implement a pipeline from the ExperiencePitt iCal feed to events_sample.json, import it into the Event/Organization tables, and update /events to read this real club data from the database.	Annie	Complete
3 [BACKEND] Event/Org API endpoints	Finalize the /events API to read from the db and add optional query parameters (e.g., org and category) so the frontend can request filtered event lists.	Sreekar	Complete
4 [FRONTEND] “Add to calendar” links	Add an “Add to calendar” link or button for each event (e.g., linking to the ExperiencePitt event page or an .ics download) so students can add events to their personal calendars.	Sreekar	Complete
5 [FRONTEND] Event list & filtering UI	Update frontend/index.html and JS to render the DB-backed event list, support at least one filter (e.g., by organization or category), and show a clear “no events” state.	Gavin	Complete
6 [FRONTEND] Event search bar	Add a simple search box on the events page that filters the displayed events by name or organization to support basic search over the event list.	Gavin	Complete

7 [ADMIN] Club official CRUD via admin	Configure Django admin so events and organizations can be created, edited, and deleted by an admin user to satisfy the “club officials manage events/orgs” FR for this sprint	Zezhong	Complete
8 [TESTING] End-to-end tests/checklist	Add at least one Django test for the /events endpoint (DB-backed) and write a short manual test checklist: create an event in admin → verify it appears and filters correctly in the UI	Zezhong	Complete
9 [DOCS] FR traceability & Git workflow	Update FR/NFR table to mark which FRs are now partially/fully implemented. Summarize on the team’s Git workflow (branches, PRs, issues) and any merge/migration issues if needed	Mike	Complete
10 [DEMO] Screenshot-based functional demo	Capture (1) events UI, (2) filtering interaction, (3) Django admin event management, (4) “before/after” of adding an event and seeing it in the UI.	Mike	Complete

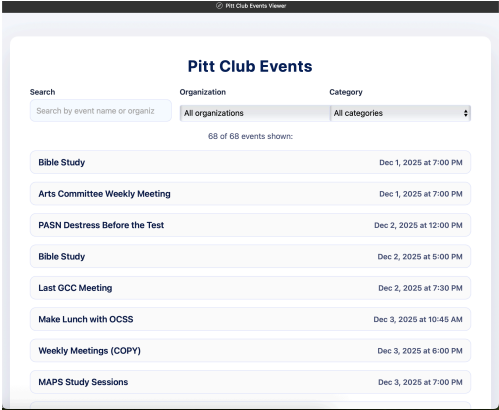

- Description of what Git workflow your team used and issues you ran into:

We followed a fork-based GitHub workflow. Each team member worked on their own fork and separate branches for specific tasks then opened pull requests into main for review and merging. This kept changes isolated and made it easy to roll back if necessary. We did not encounter any major issues; mainly focusing on coordinating who owned specific files, rebasing before opening PRs and rerunning migrations after merges to keep the database schema consistent.

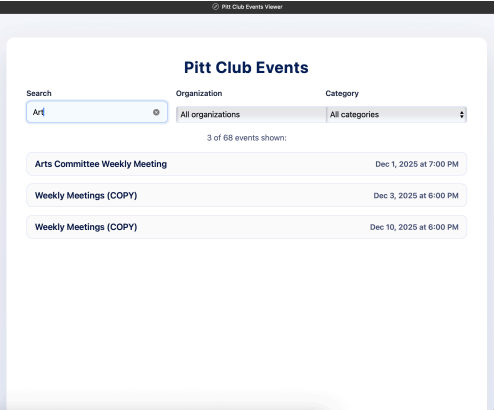

2. Functional Demo

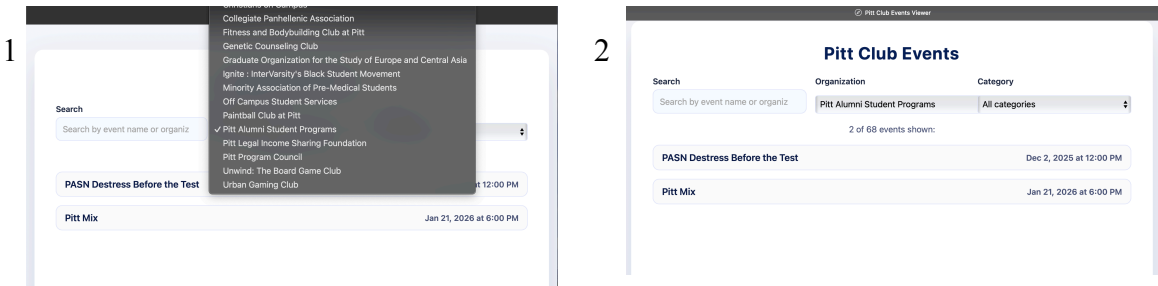

Homepage:

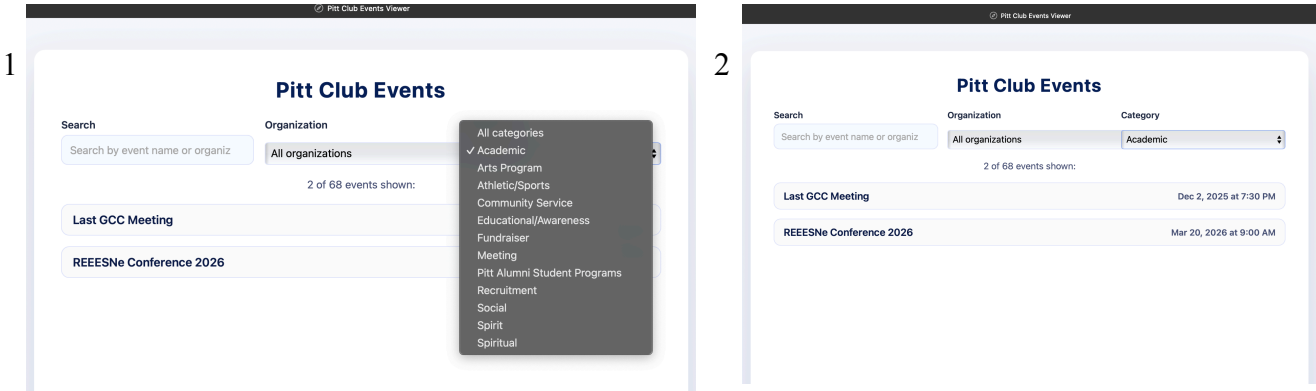

Search Function:

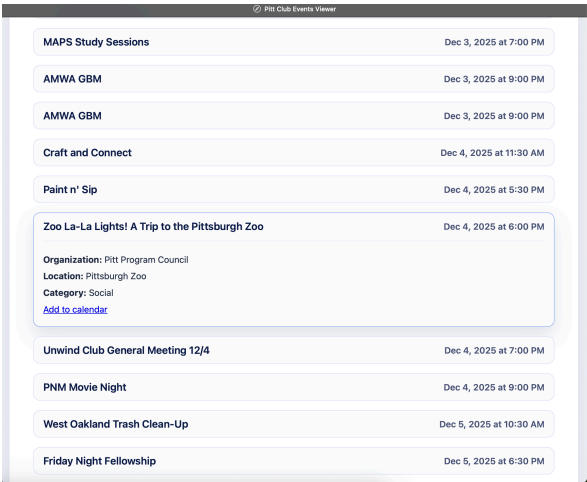

Filtering by organization:

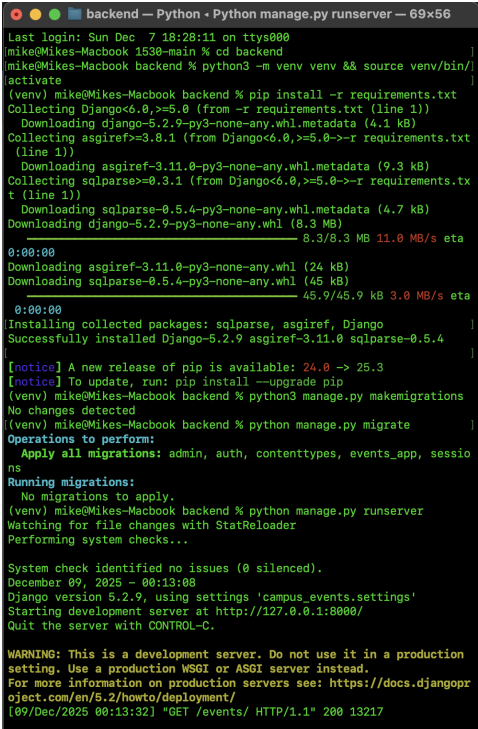

Filtering by category:

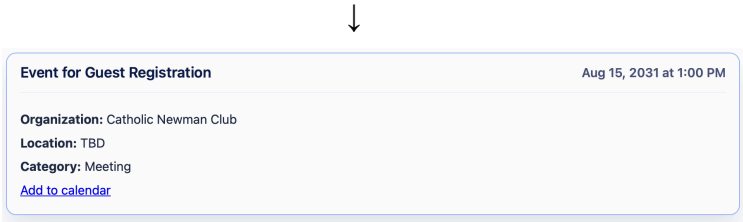

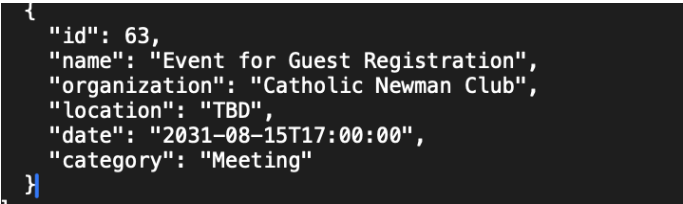

Events UI:

Backend:

Events (JSON):

Updated Functional Requirements:

Completed:

- 1.1. The system shall allow club officials to create, edit, and delete organizations and events.
- 1.2. The system shall allow students to browse, search, and filter organizations and events by category, date, and location, etc.
- 1.3. The system shall allow students to add events to their personal calendars

Future Sprints:

- 1.4. The system shall allow students to sign in using their university SSO (Single Sign-On).
- 1.5. The system shall allow students to RSVP to events and view their RSVP status.
- 1.6. The system shall provide personalized organization and event recommendations based on student interests.
- 1.7. The system shall allow students to keep track of their previously attended events.
- 1.8. The system shall allow students to receive notifications for upcoming events.
- 1.9. The system shall allow students to register for an organization
- 1.10. The system shall allow club officials to manage the registration status of users in their organization ^
- 1.11. The system shall allow attendees to check in to events using organizer-generated QR codes, updating attendance records in real time.
- 1.12. The system shall allow students to follow organizations so that events from those organizations appear more prominently in their personalized feeds and notifications.
- 1.13. The system shall allow event organizers to set capacity limits and manage waitlists, automatically promoting students when spots become available.
- 1.14. The system shall allow attendees to rate and provide feedback for events, with results visible to the corresponding organization's dashboard.
